## 4 Test Requirement

### 4.1 Test setup

#### 4.1.1 For Conducted test setup

#### 4.1.2 For Radiated Emissions test setup

Radiated Emissions setup:

Figure 2. Above 1GHz

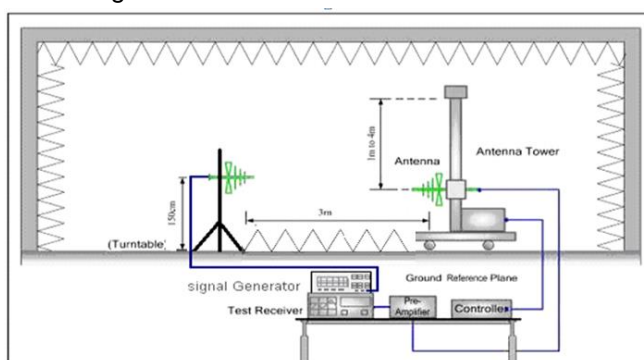

Figure 1. 30MHz to 1GHz

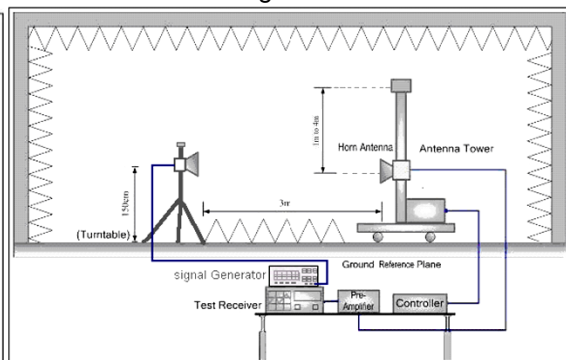

Figure 2. Above 1GHz

## 4.2 Test Environment

Environment Parameter	Selected Values During Tests		
Test condition	Ambient		
	Temperature(°C)	Voltage(V)	Humidity
TN/VN	24.5	15.2	56%
TL/VN	-10	15.2	56%
TH/VN	55	15.2	56%

Note:

- 1) The EUT just work in such extreme temperature of -25°C~+55°C and the voltage of 3.6V, so here the EUT is tested in the temperature of -25°C~+55°C and the voltage of 15.2V.
- 2) VN: Normal Voltage TN: Normal Temperature  
TL: Low Extreme Test Temperature TH: High Extreme Test Temperature

## 4.3 Test Condition

Test Mode	Tx/Rx	RF Channel		
802.11a	5150MHz ~5250 MHz	Channel 36	Channel 44	Channel 48
		5180MHz	5220MHz	5240MHz

Through Pre-scan, 6Mbps of rate the power is the worst case of 802.11a(HT20) for 5150MHz ~5250 MHz.

## Appendix B: Spurious emissions

Test Procedure:

1. Scan from 30MHz to 26GHz; find the maximum radiation frequency to measure.

2. The technique used to find the Spurious Emissions of the transmitter was the antenna substitution method. Substitution method was performed to determine the actual ERP/EIRP emission levels of the EUT.

Test procedure as below:

1) The EUT was powered ON and placed on a 1.5m high table at a 3 meter fully Anechoic Chamber. The antenna of the transmitter was extended to its maximum length. Modulation mode and the measuring receiver shall be tuned to the frequency of the transmitter under test.

2) The EUT was set 3 meters (above 18GHz the distance is 1 meter) away from the interference-receiving antenna, which was mounted on the top of a variable-height antenna tower.

3) The disturbance of the transmitter was maximized on the test receiver display by raising and lowering from 1m to 4m the receive antenna and by rotating through 360° the turntable. After the fundamental emission was maximized, a field strength measurement was made.

4) Steps 1) to 3) were performed with the EUT and the receive antenna in both vertical and horizontal polarization.

5) The transmitter was then removed and replaced with another antenna. The center of the antenna was approximately at the same location as the center of the transmitter.

6) A signal at the disturbance was fed to the substitution antenna by means of a non-radiating cable. With both the substitution and the receive antennas horizontally polarized, the receive antenna was raised and lowered to obtain a maximum reading at the test receiver. The level of the signal generator was adjusted until the measured field strength level in step 3) is obtained for this set of conditions.

7) The output power into the substitution antenna was then measured.

8) Steps 6) and 7) were repeated with both antennas polarized.

9) Calculate power in dBm by the following formula:

ERP(dBm) = Pg(dBm) – cable loss (dB) + antenna gain (dBd)

EIRP(dBm) = Pg(dBm) – cable loss (dB) + antenna gain (dBi)

EIRP=ERP+2.15dB

where:

Pg is the generator output power into the substitution antenna.

10) Test the EUT in the lowest channel , the Highest channel

Repeat above procedures until all frequencies measured was complete.

Limit:

Frequency range	Maximum power,	Bandwidth
30 MHz to 47 MHz	-36dBm	100 kHz
47 MHz to 74 MHz	-54 dBm	100 kHz
